

Where Light Moves

An Adaptive Interior System for the Modulightor Duplex

This project reimagines the Modulightor duplex as an adaptive collective interior system.

Through movable and foldable architectural elements, the space continuously reconfigures itself to support a wide range of social, cultural, and restorative activities.

Rather than relying on fixed programs, the interior operates as a flexible framework, responsive to use, light, and environmental conditions which allowing the space to shift between gathering, making, exhibiting, and resting.

Grid system

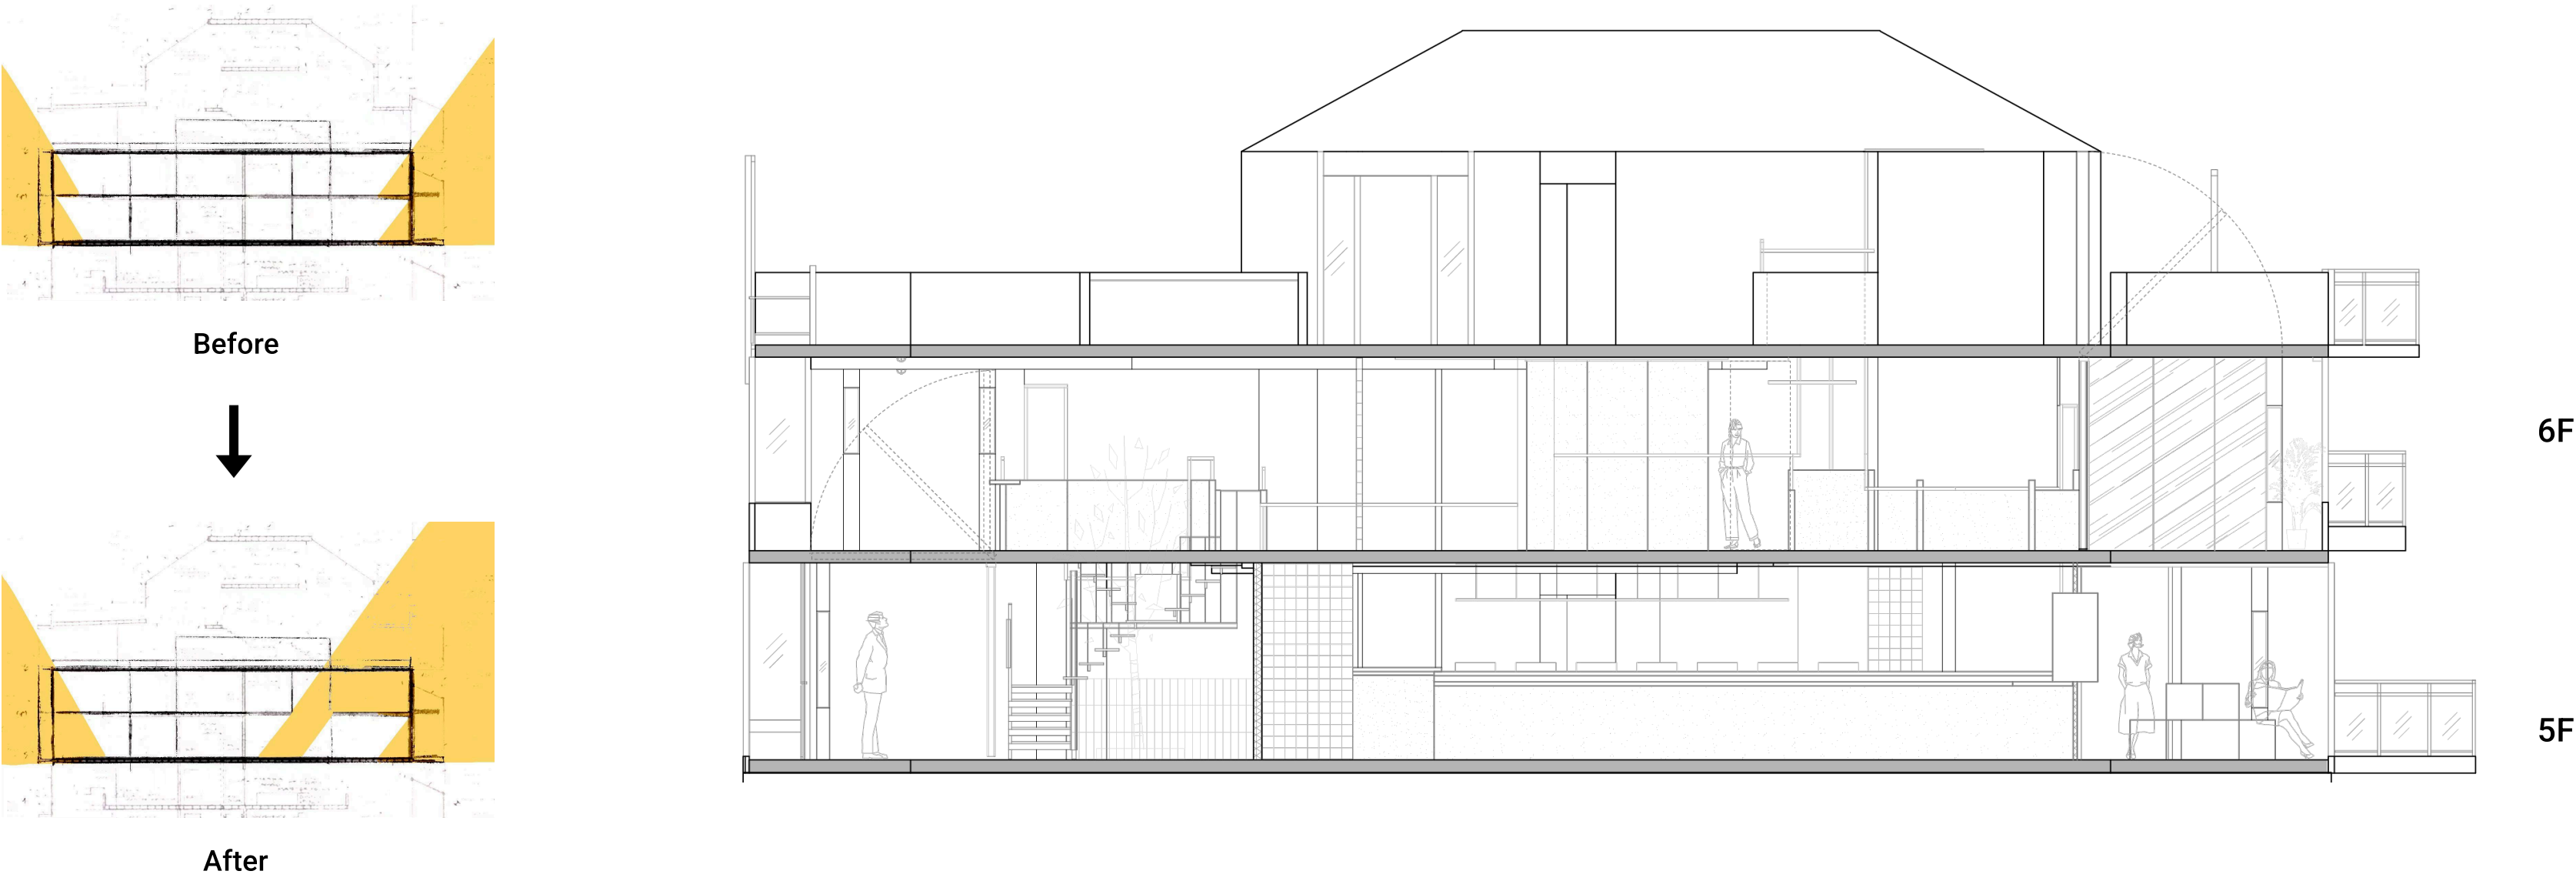

I began with this grid system.
The red lines represent reference axes taken from the building's perimeter.
The blue dashed lines indicate sightlines extending from the four corners.

Because the space is small, I wanted to stretch the visual depth as much as possible, so no walls or partitions are placed along these sightlines. The intersection of the two blue lines marks the location of the mirror.

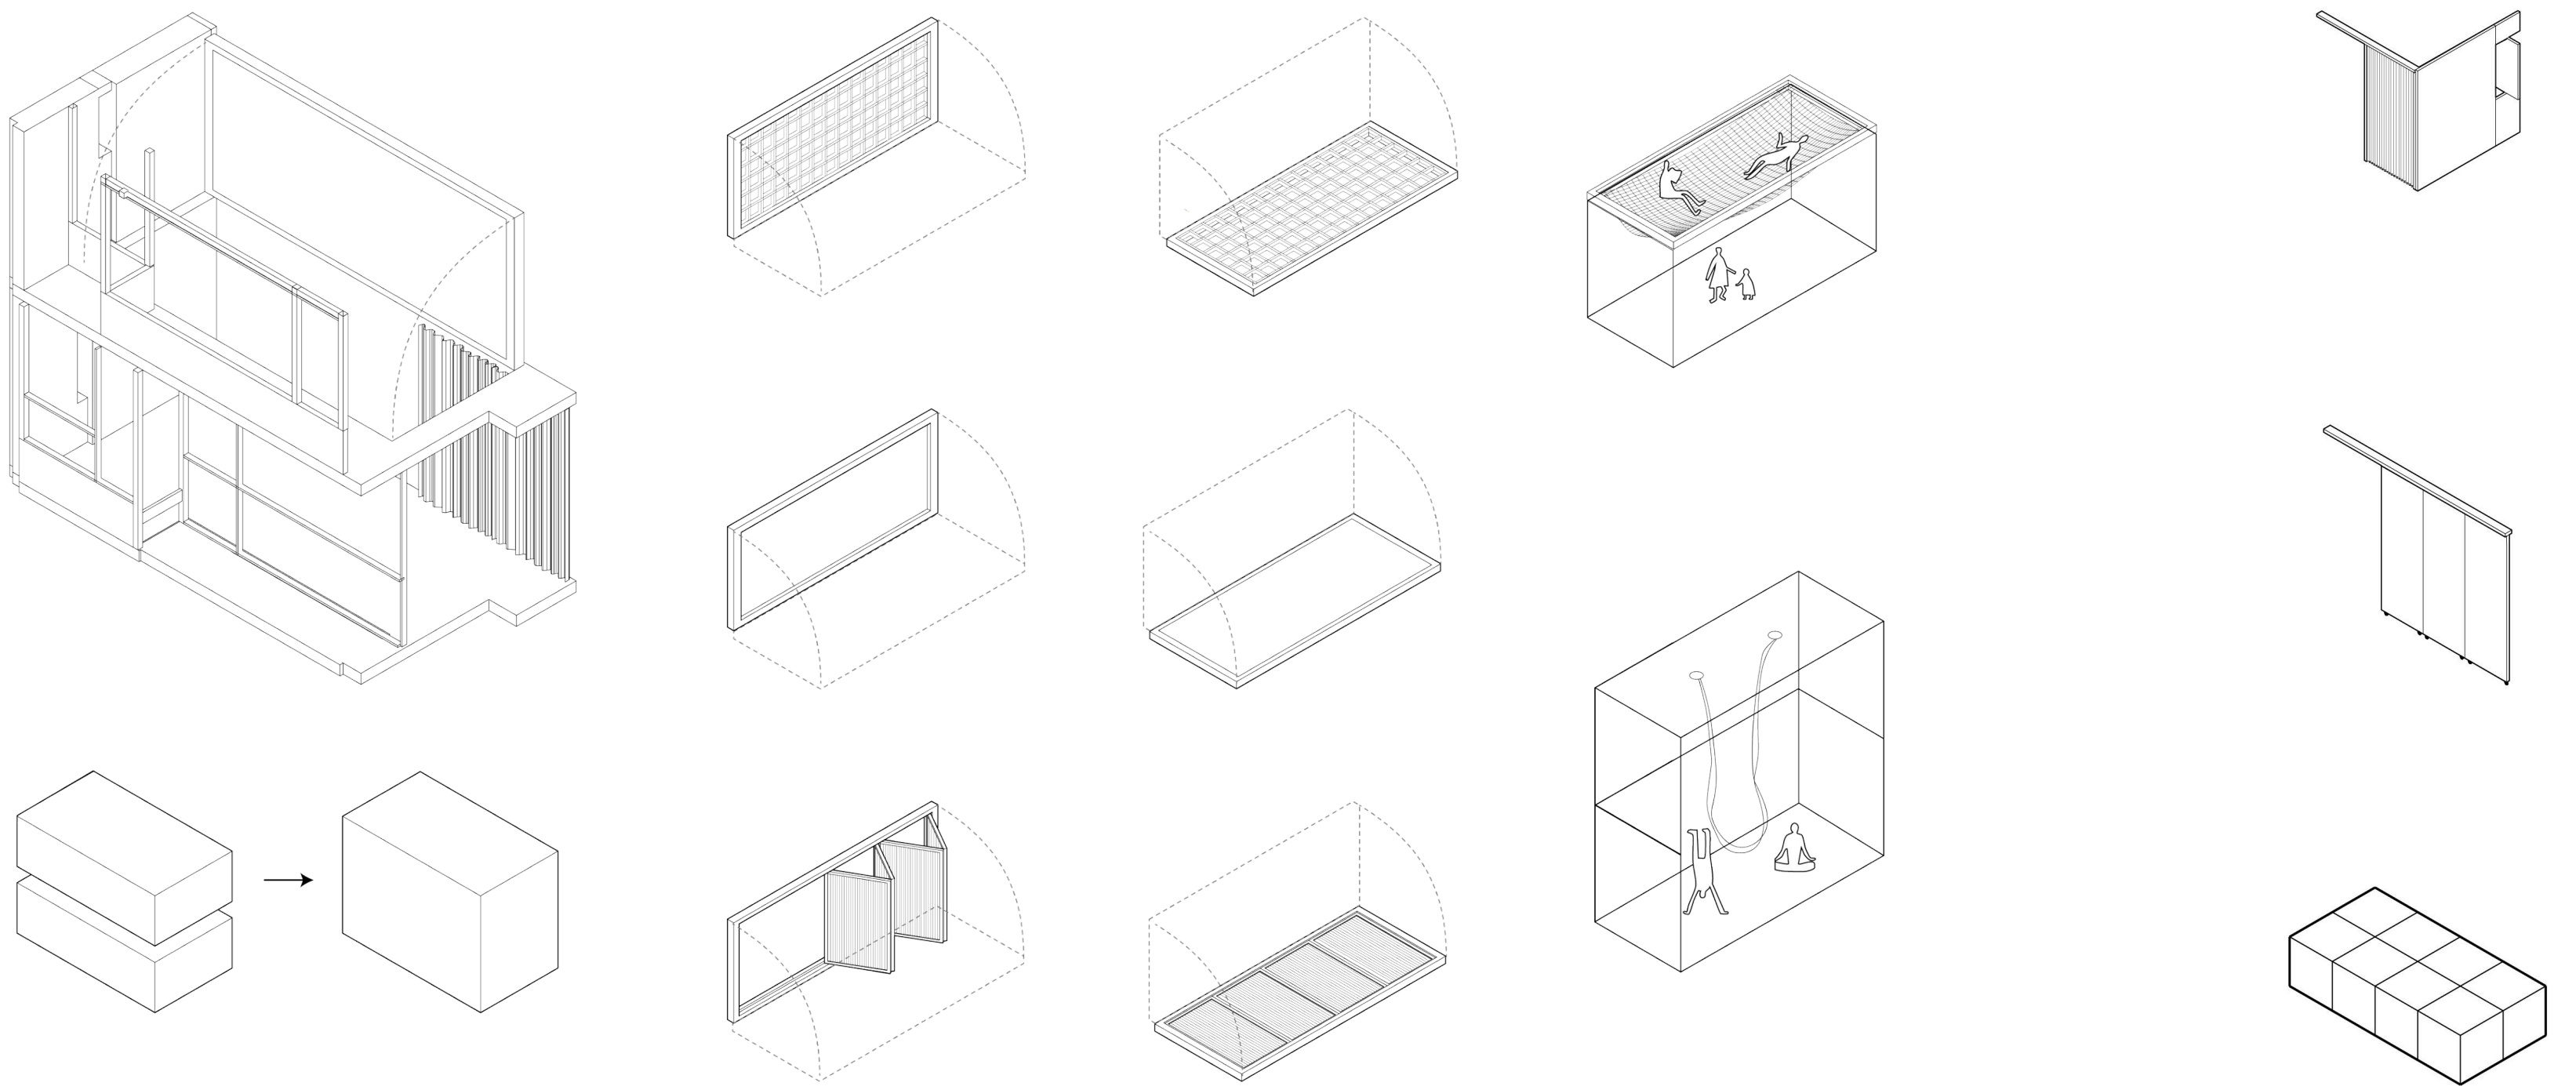

Transformation & Light

In response to light conditions and spatial characteristics, the structural interventions were adjusted to enable spatial adaptability.

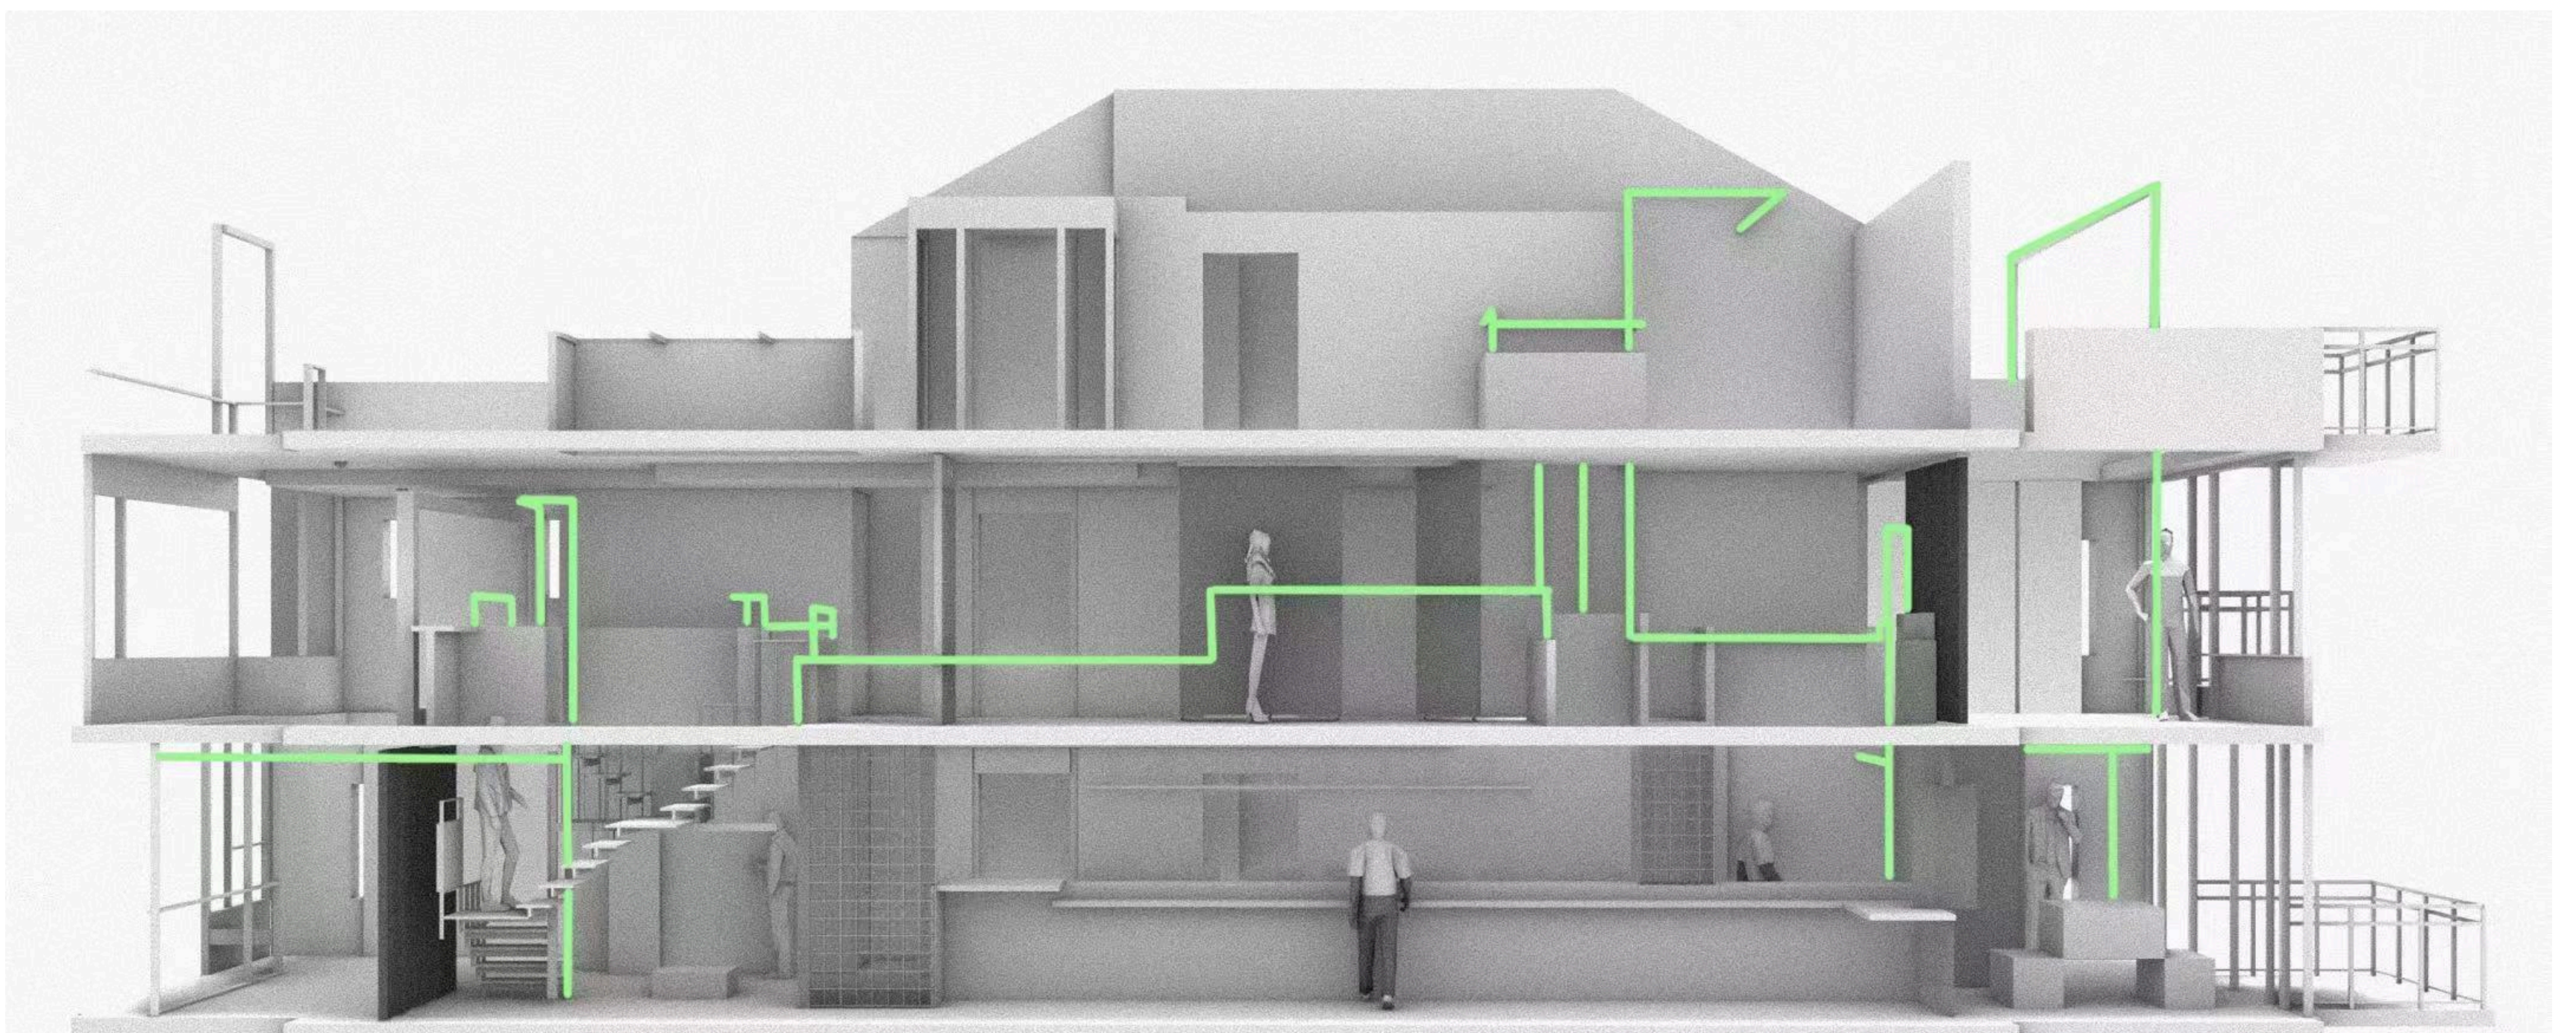

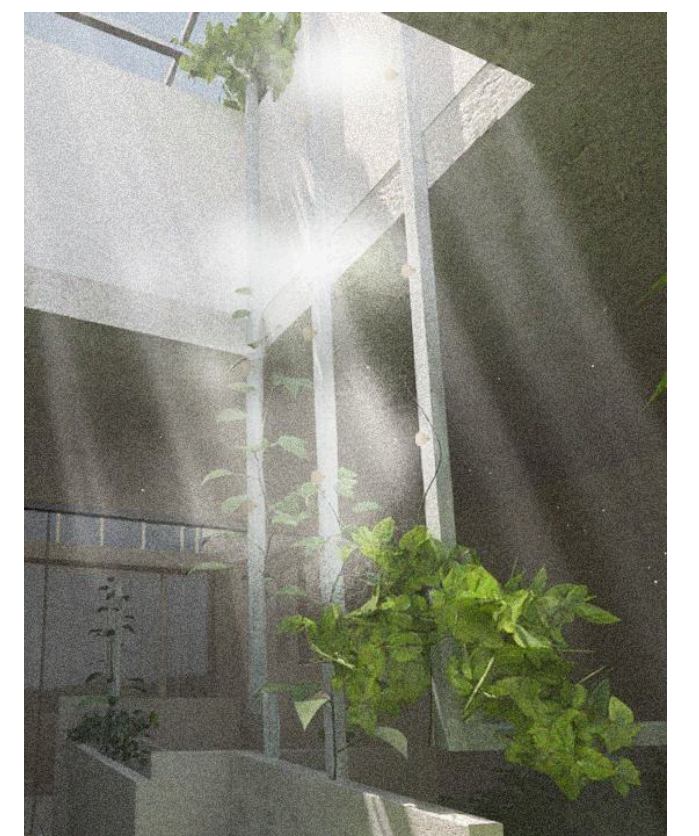

Operable ceiling modules open or close according to sunlight and temperature, while aerial yoga equipment is suspended within the double-height zone. Foldable and movable components allow the space to shift seamlessly between different programs.

Plant Boxes

A misting pipe system is integrated as a spatial and ecological element, weaving through the interior to support vine growth through automated hydration.

Beyond sustaining the plants, the fine mist reveals the geometry of light, making illumination visible and atmospheric as it drifts through the space.

I continue Rudolph's predominantly white palette, but introduce variations in translucency, reflectiveness, and surface smoothness.

Models and Sketchs
